# Wind Resource Temporal Variability Report

Diurnal and monthly variability of wind resources based on data from the NREL Wind Toolkit

### Introduction

This report provides an overview of wind resources for Mount Washington from 2012-01-01 to 2013-01-01. This analysis is based on the wind speed at 100 meters dataset within the National Renewable Energy Laboratory (NREL) Wind Integration National Dataset (WIND) Toolkit.

## **Analysis**

The graph below shows hourly wind speed for Mount Washington and the selected time range. Wind speed values are show in relation to the specified turbine cut-in and cut-out speeds.

The annual average wind speed for Mount Washington was 10.79 m/s. This is ABOVE the value of 5.8 m/s recommended by the U.S. Energy Information Administration. Wind speed was below the cut-in speed of 3.6 m/s for 820 hours. Therefore, wind turbines could not operate 9.34 percent of the time due to lack of wind. Wind speed exceeded the cut-out speed of 24.6 m/s for 84 hours. Therefore, wind turbines could not operate 0.96 percent of the time due to stong wind. Between 2012-01-01 to 2013-01-01, wind speeds at this location were within the acceptable operating range of 3.6 m/s to 24.6 m/s for 7.880 hours. Therefore, turbines could operate 89.7 percent of the time.

### Site Map

The map below shows the location of Mount Washington.
